Delve Homes: Reflective Essay

The project first started planning who does which platform. It was decided that I would do the desktop and he would do the phone platform. We would go to look and find an idea of what a website should look like. With the information we got from looking at the websites, we would start to work on our wireframe. He and I would give each other information on what we change and add to our wireframe and sometimes suggestions. On the wireframe I would have to plan on how the layout would look like. After I have an idea on the layout I would have to see where I would want an image or text there.

After figuring out where text and images go on layout. I would have to write out the content or text I would put in the section. I would also have to find the images that relate to the overall content of the website and text. After finding images we made sure our text was written in 3rd person. After fingering and making corrections to the images and text, I would make small changes on the layout.

After finishing our wireframe we would move on to the code. First thing I did was organize the folder and file to my code. I would organize my code by css, img, and html in different folders. After that I would begin my coding. A problem I ran into while coding was not

knowing how to get rid of white bars on the outside of the website. I eventually figured out it was the margin and After setting it to 0 it got rid of it.

Now to the presentation part of the project. We decided that we would talk one page after the other. In the beginning of making slides we had trouble knowing how many slides we needed, but looking through the questions for each topic we ended up with 10 slides. After finishing the slides we adjusted and changed some words to make the slides look better. Then we time ourselves on the slide. Then add more to the script because the time wasn't long enough.

The challenge we face in the project is planning. A thing that we did well on is coming up with ideas for the project. A challenge I faced was coding and knowing what to put in and adjust code. I think I did well on making the slides.
